GROUP AND PART INDEX (CONT'D)

foreword...

This 1977 Truck Shop Manual has been prepared to provide information covering normal service repairs and maintenance for 1977 Ford Trucks manufactured in the United States and Canada. It is divided into five volumes, each covering a specific major area:

Volume 1 — Chassis
Volume 2 — Engine
Volumes 3 & 4 — Body and Electrical
Volume 5 — Pre-Delivery, Maintenance and Lubrication.

Information in each volume is divided into Groups covering a general system. The table of contents on the cover of each volume indicates the Group title, number, and volume in which each Group is located.

For 1977, the basic part number for components covered in the Group is also included in parenthesis after the Group number.

Example: Cooling System (General System Covered in Group) Group 27 (Group Number) (8000) (Basic Part Number for Cooling System Components)

Some components covered within a Group do not have the same basic part number. In these cases, more than one basic part number will appear on the Group index.

Example: Gasoline Engines (General System Covered in Group) Group 21 (6000 (Basic Part Number for Gasoline Engine Components) & 9000) (Intake and Exhaust Manifold Basic Part Number Only)

For easy reference, information in each Group has been divided into smaller units or Parts. There is one Part for each component in the system, as well as a General Service Part in some Groups to cover procedures common to several components within the Group. In general, each Part contains the Description, Operation, Diagnosis and Testing, Removal and Installation and Disassembly and Assembly procedures for the component covered in the Part. Diagnosis Charts are also included in some Parts to help you systematically locate and correct problems encountered. In most cases, specifications are included at the end of each Part.

To aid in locating specific items in this manual, the index at the front of each volume provides an alphabetical listing, with page number, for all Parts in the volume. The tab locator on the right side of this index will help you find the first page of each Group.

On the first page of each Group there is an index listing the Part title and Part number for each component covered within the Group. The first page of each Part contains an index to locate service operations covered in that Part. This Group-Part breakdown is also indicated in the page number located at the top of each page.

Example: 11-02-21 = (Group) 11 — (Part) 02 — (Page) 21

Metric conversion tables have been included at the back of each volume to aid in converting specifications in this manual to the metric equivalent.

The descriptions and specifications in this manual were in effect at the time this manual was approved for printing. Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring obligation.

IDENTIFICATION CODES

GROUP 10

GENERAL INFORMATION

VEHICLE CERTIFICATION LABEL

The Vehicle Certification Label (V.C. Label) is attached to the rear face of the driver's door or door pillar. The upper half of the label contains the name of the manufacturer, the month and year of manufacture and the certification statement. The V.C. Label also contains the Vehicle Identification Number.

The remaining information codes on the V.C. Label are the same as the Truck Rating Plate Codes (Fig. 1). Vehicle codes shown on the Truck Rating Plate are explained in the following paragraphs.

RATING PLATE

Fig. 1 illustrates a typical Truck Rating Plate. On light and medium cowl and windshield vehicles, the Rating Plate is mounted on the right side of the cowl top panel under the hood. On stripped Parcel Delivery vehicles, the rating plate is placed in an envelope stapled to the dunnage box. On Bronco models, the plate is mounted on the inside panel of the glove compartment door. On all other vehicles, the Rating Plate is mounted on the rear face of the left front door.

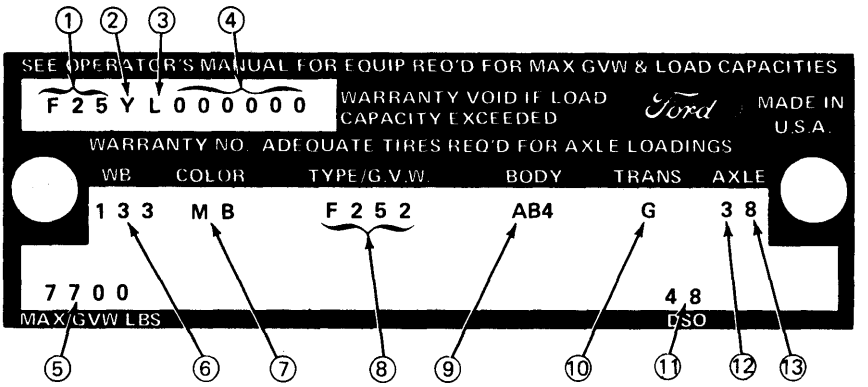
VEHICLE IDENTIFICATION NUMBER (Vehicle Serial and Warranty)

The identification number is the first line of numbers and letters appearing on the Rating Plate (Fig. 1). The first letter and two numbers indiate the truck series code. The letter following the truck series code designates the engine identification code. The letter following the engine identification code indicates the assembly plant at which the vehicle was built. The remaining numbers indicate the consecutive unit number (serial and warranty number). The charts that follow list the various vehicle identification number codes.

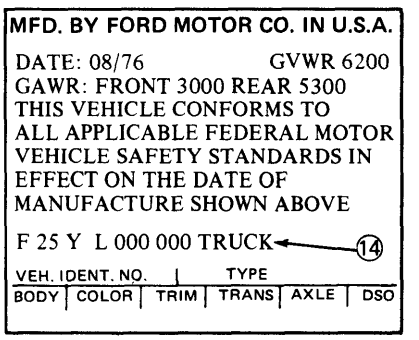
VEHICLE DATA

The Vehicle Data appears on the Rating Plate on the two lines following the identification number. The first three digits under W.B. designate the wheelbase in inches. The one or two letters under COLOR identify the exterior paint color (two letters designate a two-tone). The letter and three digits under TYPE/G.V.W. designate the truck model within a series and the gross vehicle weight rating. The letter and numerals under BODY designate the interior trim, seat and body type. (See Figs. 2, 3 and 4.) The transmission installed in the vehicle is identified under TRANS by either a numeric or alphabetical code (if two symbols appear, the first identifies the auxiliary transmission, if so equipped, and the second symbol identifies the main transmission). A letter and a number or two numbers under AXLE identify the rear axle ratio (when required, a letter is also stamped behind the rear axle code to identify the front axle capacity). The maximum gross vehicle weight in pounds is stamped under MAX. G.V.W.

A two-digit number is stamped under D.S.O. to identify the district which



1. TRUCK SERIES CODE
2. ENGINE CODE
3. ASSEMBLY PLANT CODE
4. CONSECUTIVE UNIT AND WARRANTY NO.
5. RECOMMENDED MAX.
6. WHEEL BASE
7. EXTERIOR PAINT CODES
8. MODEL CODE AND GVW
9. INTERIOR TRIM, SEAT AND BODY/CAB TYPE
10. TRANSMISSION CODE



VEHICLE CERTIFICATION LABEL

11. DISTRICT/SPECIAL ORDER CODES
12. REAR AXLE CODES
13. FRONT AXLE CODES (IF SO EQUIPPED)
14. VEHICLE TYPE

W1017-K

Vehicle Certification Label

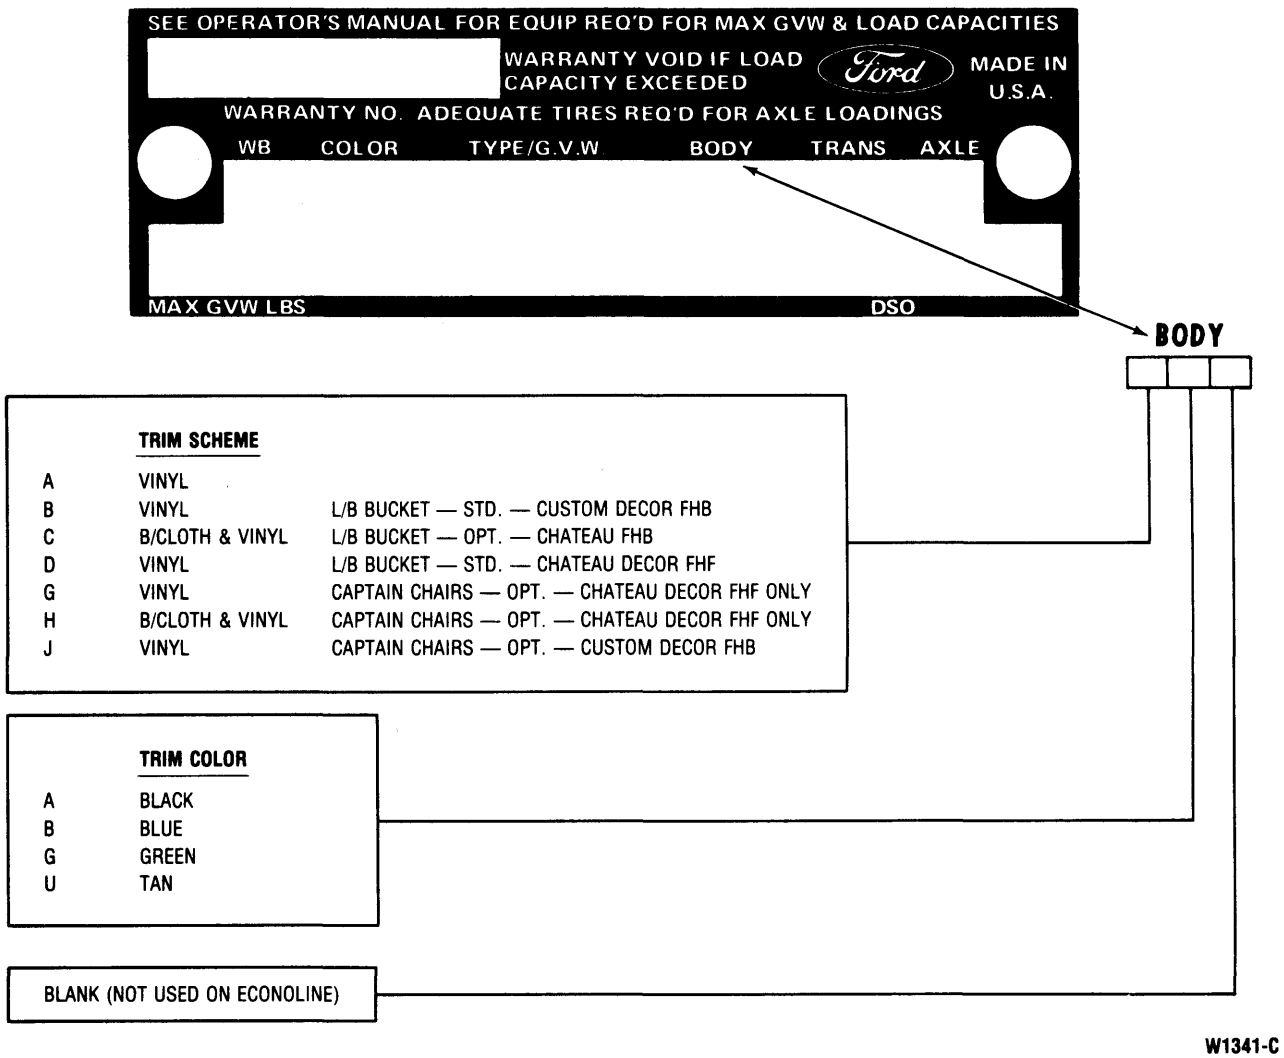


FIG. 2 Trim, Seat, Body—Cab Type Identification—Econoline-Vans and Club Wagons

ordered the vehicle. If the vehicle is built to special order (Domestic Special Order, Foreign Special Order, Limited Production Option, or other special order), the complete order number will also appear under D.S.O. The charts that follow list the various vehicle data codes.

W.B. (WHEELBASE)

The wheelbase in inches in entered in this space.

MAX. G.V.W. LBS

The maximum gross vehicle weight in pounds is recorded in this space.

D.S.O.

If vehicle is built on a D.S.O., F.S.O., L.P.O. (special orders) the complete order number will be reflected under the D.S.O. space including the District Code Number.

ECONOLINE CLUB WAGONS VEHICLE NUMBERING SYSTEM

The Uniform Sequential Serial and Warranty Numbering System for the $977 Model Year Program is outlined as follows:

SERIAL & WARRANTY NO. BLOCKS BASED UPON THE SCHEDULED MONTH

1977 Model Program

*Job #1 1977				
August*	000,000 — 019,999	January	X80,000 — X99,999
September	020,000 — 039,999	February	Y00,000 — Y19,999
October	040,000 — 059,999	March	Y20,000 — Y39,999
November	060,000 — 079,999	April	Y40,000 — Y59,999
December	080,000 — 099,999	May	Y60,000 — Y79,999
		June	Y80,000 — Y99,999
		July	Z00,000 — Z19,999
		August	Z20,000 — Z99,999

1976 Model Program

For record purposes the 1976 Model Year Serial Number is shown to reflect August thru 1976 Model Build Serial Numbers.

*Job #1 1976	1975 Calendar Year		1976 Calendar Year	
August*	A00,000 — A24,999	January	B25,000 — B49,999
September	A25,000 — A49,999	February	B50,000 — B74,999
October	A50,000 — A74,000	March	B75,000 — B99,999
November	A75,000 — A99,999	April	C00,000 — C24,999
December	B00,000 — B24,999	May	C25,000 — C49,999
		June	C50,000 — C74,999
		July	C75,000 — C99,999
		August	D00,000 — D24,999

BRONCO-LT TRUCK-MED TRUCK-SCHOOL BUS-100 THRU 600 VEHICLE NUMBERING SYSTEM

SERIAL & WARRANTY NO. BLOCKS BASED UPON THE SCHEDULED MONTH

Starting Serial Number for all Bronco F100-350 F & B 500-600 is 000,000

*Job #1 1977	1976 Calendar Year		1977 Calendar Year		
		Kentucky Truck Plt. F & B 500-600			Kentucky Truck Plt. F & B 500-600
August	000,000 — 019,999	000,000 — 004,999	January	X80,000 — X99,999	X80,000 — X84,999
September	020,000 — 039,999	020,000 — 024,999	February	Y00,000 — Y19,999	Y00,000 — Y04,999
October	040,000 — 059,999	040,000 — 044,999	March	Y20,000 — Y39,999	Y20,000 — Y24,999
November	060,000 — 079,999	060,000 — 064,999	April	Y40,000 — Y59,999	Y40,000 — Y44,999
December	080,000 — 099,999	080,000 — 084,999	May	Y60,000 — Y79,999	Y60,000 — Y64,999
			June	Y80,000 — Y99,999	Y80,000 — Y84,999
			July	Z00,000 — Z19,999	Z00,000 — Z04,999
			August	Z20,000 — Z99,999	Z20,000 — Z24,999

For record purposes the 1976 Model Year Serial Numbering is shown starting Serial Number for all Bronco F100-350 F & B 500-600 is A00,000

*Job #1 1976	1975 Calendar Year		1976 Calendar Year	
August	A00,000 — A24,999	January	B25,000 — B49,999

WHEELS AND TIRES

GROUP 11 (1000 & 2000)

General Wheel and Tire Service

PART 11-01

APPLIES TO ALL MODELS

SAFETY

When replacing tires, use the same size, load range and construction type (bias, bias belted or radial) as originally installed on your vehicle. When replacing wheels, use original equipment [illegible]lent with and [illegible]ose Use [illegible]es [illegible]d

carrying capacity, bearing life, tire clearance to body and chassis components, vehicle ground clearance, vehicle width and brake cooling.

SAFETY PRECAUTIONS WHEN SERVICING TRUCK TIRES

CAUTION AND SAFETY FIRST are bywords when handling tires, **particularly truck tires.** Careful attention to the suggestions that follow may prevent crippling injuries, or even death. **Make it a rule to respect the terrific force contained in an inflated tire.** You may be glad some day that you did.

Prepare for any tire repair operation in a safe and efficient way. In changing tires on drop center wheels, remove the wheel and tire from the truck, **as changing tires with the wheel on the truck is hazardous, more difficult, and takes more time.** In servicing of all tires use caution not to drop them (or the wheels or assemblies) on the feet, hands

F1857-A

FIG. 1 Handling Wheels and Tires

F1853-A

FIG. 2 Safe Air Removal

or body, or heavily on the floor (Fig. 1). Practice good methods of lifting; use your legs as well as your arms and your body. This will help to prevent painful, internal injury. When carrying tires or wheels don't step in oil or grease. **Keep the floor clean and dry.**

Deflating a tire properly is very important to your safety. First, reduce the pressure as much as you possibly can by pushing the valve core plunger. **Only then should you remove the valve core.** Keep your eyes away from the valve: Fig. 2 shows the safe way to do it.

Demounting tires from wheels or rims requires special care. Tires on drop center rims are best handled on a wheel holder, or tire-changing machine (Fig. 3).

F1858-A

FIG. 4 Use of Tire Irons

This can help prevent cuts on hands and wrists and will make it unnecessary to use a mallet for seating the tire.

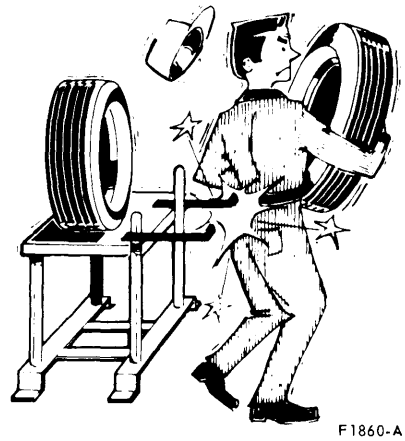
Use only standard tire mounting tools and equipment. The use of makeshift tools, screwdrivers or pliers to force tires on or off rims or wheels is dangerous.

Always lubricate tire beads to assure sealing of tire beads on rim.

The Rotunda tire changer includes a bead seater/inflator using an automatically adjustable inflation ring, which aids in properly seating the bead for inflation. To properly operate the Rotunda tire changer, follow the instructions provided.

As with the drop-center rims, be certain on split-rim assemblies that all air is out before unlocking a rim or ring. **Use special care when using tire irons.** Grip them firmly and keep them free of oil and grease. They can slip and fly with tremendous force (Fig. 4).

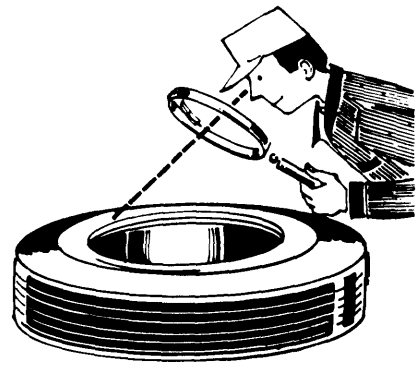
A careful inspection should be made of the tire and all necessary repairs should be performed. A tire spreader is very helpful (Fig. 5) but use care when working around it. Keep the spreader arms closed when the machine is idle.



F1860-A

FIG. 5 Tire Spreader

Inspect the rim parts carefully for rust, damage or distortion (Fig. 6). Never use rims, locking rings or flanges which are out of shape, rusted or cracked or broken in any way. **Never use a ring or other rim parts of different manufacture than the original rims or any different size or type.**



F1854-A

FIG. 6 Visual Inspection

Tires and rims often require a buffing operation before being mounted once the regular repairs have been made.

Always wear Safety Goggles, or a face shield when performing any buffing operation.

Avoid hammering rings or rims with steel hammers. Small bits of steel may be broken off the hammer or rim, flying into the eyes (wear safety goggles) face or body. Use rubber-covered, steel-headed hammers wherever possible (Fig. 7). Rubber mallets only should be used on passenger car tires; although with modern tire changing equipment no pounding is necessary.

Make certain the rim ring is seated to full depth of the groove, fits tightly all around, and is securely locked.

F1859-A

FIG. 7 Seating of Rings

Stand away from the valve stem as far as possible while inflating tires. Avoid a position where the face or body is immediately over the work being done on any tire in which there is pressure.

F1855-A

FIG. 8 Inflation Details

With certain types of wheels, however, it is necessary to seat the rings while the tire is being inflated. In either case **before inflating study the next step.**

Attach a portable safety device, made especially for the purpose, to the assembly. This portable device should be used with all types of wheels and rims.

If the assembly is not of the type which requires inflation to seat the rings, a **Safety Cage** should be used, although the portable device is the best (Fig. 8).

Use only accurate, tested gauges to insure proper air pressure. Check all gauges regularly with a master gauge.

Play it SAFE. Set a good example for others who work with you. Follow the above suggestions completely. **If you are ever tempted to take a short cut because you are in a hurry, that is the time that you could get hurt.**

Finally, always remember, a jack is provided for wheel and tire maintenance only. **Never run the engine when the vehicle is supported by a jack.**

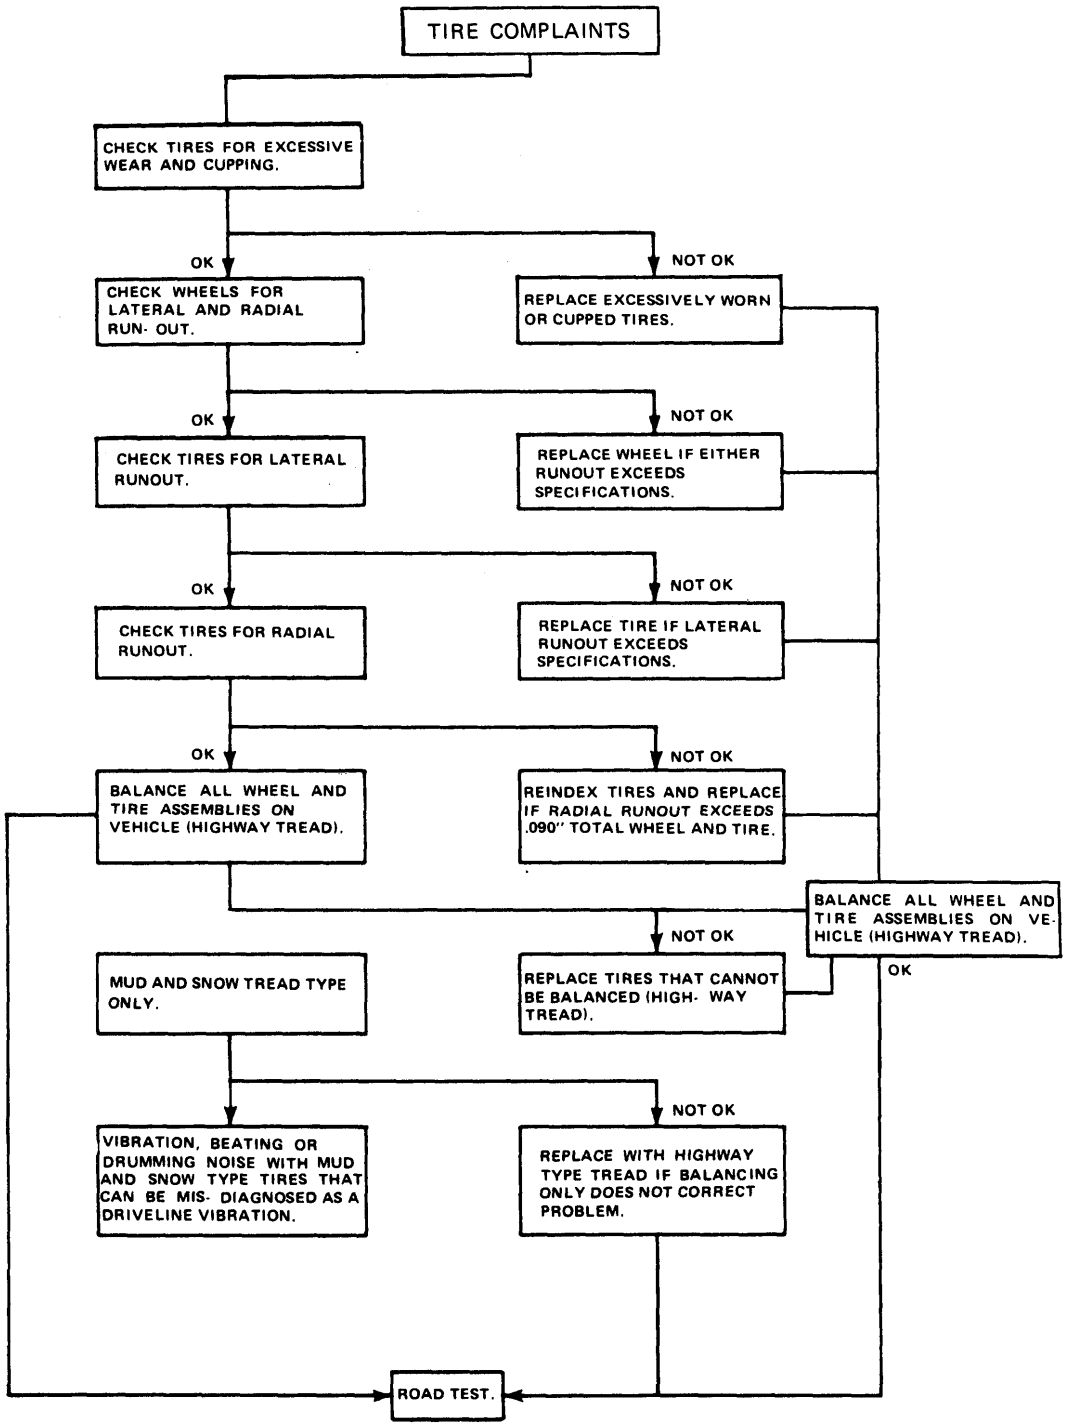
DIAGNOSIS AND TESTING

DIAGNOSIS CHARTS

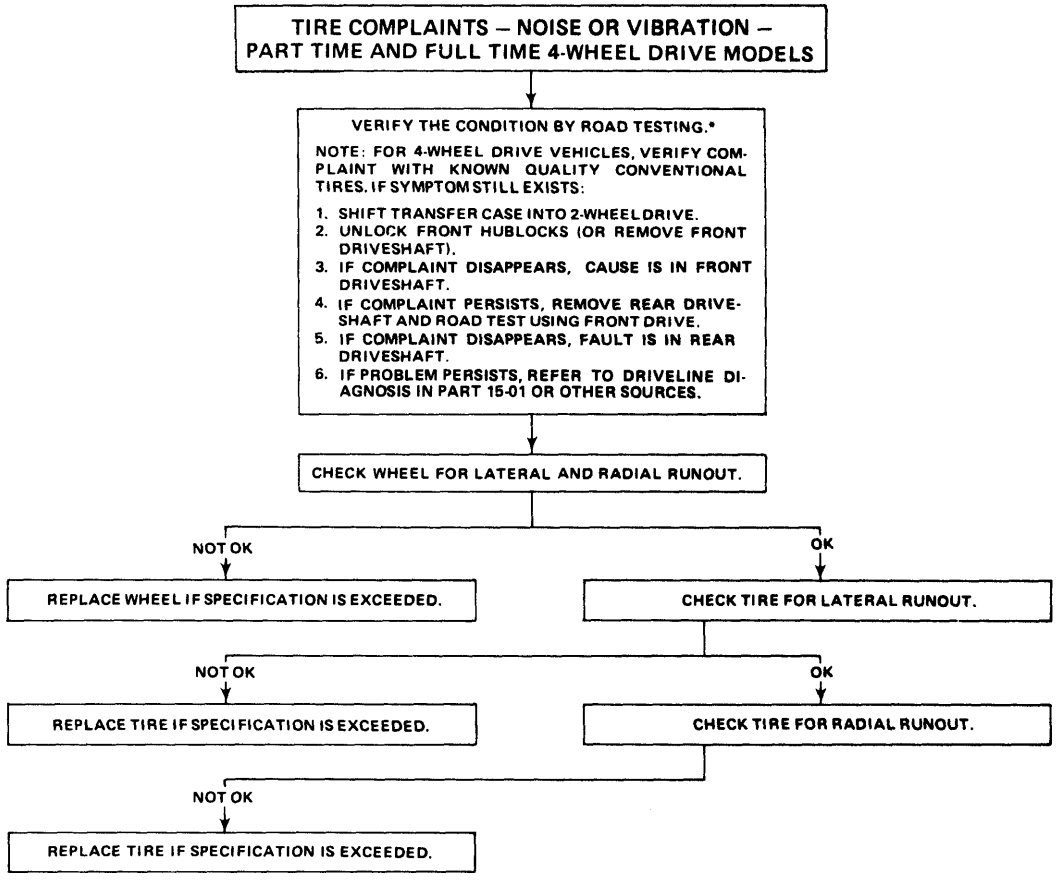
The following charts can be used as an aid in wheel and tire service diagnosis.

PROBLEM	POSSIBLE CAUSE	CORRECTION
• Tires show excess wear on edges of tread	• Underinflated tires • Vehicle overloaded • High speed cornering • Incorrect toe setting	• Adjust air pressure in tires • Correct as required • Correct as required • Set toe to specifications
• Tires show excess wear in center of tread	• Tires overinflated	• Adjust air pressure in tires
• Excessive tire wear problems	• Improper tire pressure • Incorrect tire/wheel usage • Loose or leaking shock absorbers • Front wheels out of alignment • Front wheel bearings out of adjustment • Loose, worn or damaged steering linkage or joints • Loose, worn or damaged suspension components, bushings and ball joints • Wheels and tires out of balance • Excessive lateral and/or radial runout of wheels and tires	• Adjust air pressure in tires • Install correct tire/wheel combination • Tighten or replace as necessary • Align front wheels • Adjust front wheel bearings • Inspect, repair or replace as required • Inspect, repair or replace as required • Balance wheels and tires • Check, repair or replace as required

CF2458-A



CF2458-A1



* FULL TIME DRIVE EXCEPTIONS:

1. REMOVE FRONT DRIVE SHAFT.
2. SHIFT TRANSFER CASE INTO HI LOCK AND ROAD TEST.
3. IF COMPLAINT PERSISTS, REMOVE REAR DRIVE SHAFT, SHIFT TRANSFER CASE TO HI LOCK AND ROAD TEST USING FRONT DRIVE AXLE.

ALL OTHER INFORMATION APPLIES TO FULL AND PART TIME 4-WHEEL DRIVE.

ADJUSTMENTS

WHEEL AND TIRE CHECKING PROCEDURE

Inspect tires for wear from incorrect mounting misalignment, loose wheel bearings, bent wheels, or cupping or scalping from inbalance. Tires which show irregularities and definite roughness must be replaced.

See the instructions provided with the Rotunda Wheel Balancer.

Make certain that the brakes are not dragging and wheel bearings are properly adjusted before attempting to spin the wheels. On vehicles equipped with disc brakes, push the brake shoes into the caliper to free the rotor.

Procedure to Diagnose Tire and Wheel Runout

NOTE: Remove mud and snow type tires before attempting to correct any moving vehicle vibration problems.

1. Promptly after road test, raise vehicle on a hoist to prevent tire flat spots.
2. Spin front wheels fast enough by hand to check bearings for roughness.
3. Using a tire dial indicator Fig. 9 check the radial and lateral runout of the tire and wheel assembly. If both runouts are less than .090 inch, proceed to tire balancing.

NOTE: To insure an accurate reading, rotate the tire and wheel assembly by hand, slowly so that the indicator pickup roller does not vibrate or chatter.

4. If the LATERAL RUNOUT of the tire and wheel assembly is more than .090 inch, check the wheel runout. If the wheel lateral runout is more than .045 inch, replace the wheel. If the lateral run-out is less than .045 inch, replace the tire. After replacing a wheel and/or tire recheck run-outs.
5. If the RADIAL RUNOUT of the tire and wheel assembly is more than .090 inch, mark the point of the highest runout on the tire. Check the radial runout of the wheel. If the runout is more than .045 inch, replace the wheel. If the runout is less than .045 inch, mark the point of the lowest runout on the wheel, dismount the tire from the wheel and align the mark on the tire (high spot) and the mark on the wheel (low spot). Remount the tire on the wheel.

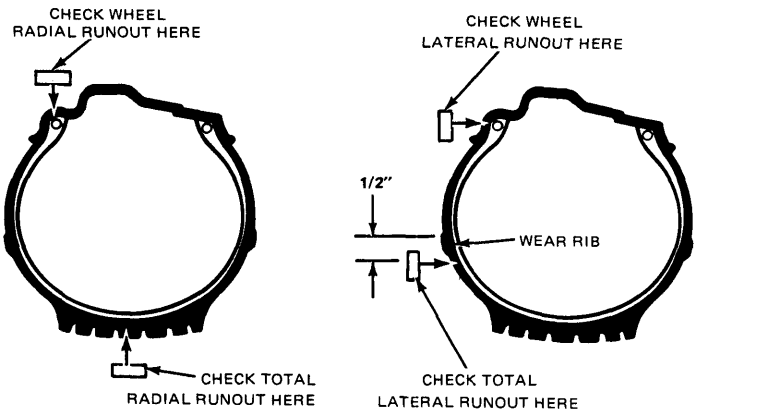


FIG. 9 Correct Placement of Runout Indicator Pickup

wheel bead area. Overinflate tire to seat bead (but not more than 45 psi for passenger type tires, or 80 psi for tube-type or 60 psi for tubeless truck type tires), then bleed to recommended pressure.

6. Balance all four wheel and tire assemblies using an on-the-vehicle balancer.
7. Remove balance equipment, spin tire to speed and allow to coast down to verify balance.
8. Imbalanced brake drums can also cause a vibration similar to wheels and tires, or driveline. Remove rear wheels and tires, engage transmission. Drive rear hubs and drums 30-50 MPH, if vehicle vibrates static and dynamic balance drums; and then wheels, tires and drums as an assembly. Install on vehicle and check for vibration. Road test for final result.

BALANCING WHEELS

Balancing Single Rear Wheels

Don't use the spinner on any single rear wheels.

Jack up one rear wheel at a time, locate the jack securely under the frame, approximately one-foot ahead of the rear wheel. Make sure the jack is secure and safe.

Spin the wheel with the engine and transmission in high gear at 30—40 mph on the speedometer. Do not spin powered wheels with a wheel spinner. Start the wheel as gradually as possible. Take care to avoid jerking condition on trucks equipped with an automatic shift. Use an accelerator pedal prop on vehicles not equipped with a hand throttle.

To balance, place the pick-up as close to the wheel as possible; then, with the wheel spinning at the speed where the maximum vibration is showing, read the strobe and follow the same procedure as balancing front wheels.

Balancing Rear Wheels of Truck with Semi-lock Differential

Use one of the following methods for rear wheels:

1. Place a jack under the frame, one foot ahead of the rear wheel you want to balance. Jack up the wheel. Place another jack under the axle near the opposite rear wheel, and raise the wheel. Place the pick-up under the wheel. Spin the wheel with the motor to approximately 60—70 mph, to where the most vibration shows. Read the strobe and follow the same procedure required for balancing front wheels.
2. Jack up the rear wheels as noted in step 1. Remove the rear wheel opposite the wheel you are to balance. Balance the rear wheel on the vehicle and reinstall the other wheel. After reversing the position of the jacks, balance the opposite rear wheel. Do not remove the first rear wheel.

Balancing Dual Wheels and Wheels of Trucks Equipped with Full Floating Axles

Jack up the rear wheels with the jack located securely under the differential housing. Raise the wheels 1-1/2 inches from the floor.

Disconnect the wheel from the axle drive by removing the hub flange nuts or screws. Pull the hub flange out to clear the studs at least 1/2 inch.

Spin Dual Wheels with an 800-C2 or 500-C Heavy-Duty Truck Spinner or equivalent.

FRONT WHEEL BEARING MAINTENANCE

Wheel bearings are adjustable. Satisfactory operation and long life of bearings depend on proper adjustment and correct lubrication. **If bearings are adjusted too tightly, they will overheat and wear rapidly. An adjustment that is excessively loose can cause pounding and contribute to uneven tire wear, steering difficulties and inefficient brakes. The bearing adjustment should be checked at regular inspection intervals.**

CLEANING AND INSPECTION

WHEELS

Wheel stud nuts should be inspected and tightened twice within the first 500 miles of operation. After the first 1000 miles of operation, they should again be inspected and tightened. Loose wheel stud nuts may cause shimmy and vibration. Elongated stud holes in the wheels may also result from the loose stud nuts.

Keep the wheels and hubs clean. Stones or lumps of mud wedged between the wheel and drum will unbalance a wheel and tire.

Check for damage that would affect the runout of the wheels. Wobble or shimmy caused by a damaged wheel will eventually damage the wheel bearings and cause uneven tire wear. Inspect the wheel rims for dents that could permit air to leak from the tires.

TIRES

The tires should be checked frequently to be sure that the air pressures agree with those specified for the tires and vehicle model. Inspect the tire tread, and remove all stones, nails, glass or other objects that may be wedged in the tread. Check for holes or cuts that may permit air leakage from the tire, and make the necessary repairs.

Inspect the tire side walls for cuts, bruises, and other damage. If internal damage is suspected, demount the tire from the wheel for further inspection, repair or replacement.

Check the tire valve for air leaks, and replace the valve if necessary. Replace any missing valve caps.

On F-100, -250, -350, Econoline and Bronco models, it is important that all wheels be balanced. Fig. 10 describes common tire wear conditions.

FRONT WHEEL BEARINGS

Wheel bearings are adjustable, to correct for bearing and shoulder wear of the spindle. Satisfactory operation and long life of bearings depend on proper adjustment and correct lubrication. **If bearings are adjusted too tightly, they will overheat and wear rapidly. An adjustment that is excessively loose can cause pounding and contribute to uneven tire wear, steering difficulties and inefficient brakes. The bearing adjustment should be checked at regular inspection intervals.**

Front hub assemblies and bearings should be cleaned, inspected and lubricated whenever the hub assemblies are removed or at the mileage/time periods indicated in the maintenance schedule.

New hub assembly grease seals should be installed when the hub is removed. A damaged or worn seal may permit bearing lubricant to reach the brake linings, resulting in ineffective brake operation and necessitating premature replacement of linings.

Bearing adjustment is described in Part 11-10 for front wheels. Part 11-12 covers front drive bearing adjustment. Parts 11-11 and 11-14 cover rear wheel bearing adjustments.

Wheels and Tires — Drop-Center Rim

PART 11-02

APPLIES TO BRONCO, E-100-E-350, F-100-F-350, P-500, AND MEDIUM TRUCKS

DESCRIPTION

FRONT WHEEL ASSEMBLY

Each front wheel and tire assembly is bolted to its respective front hub and brake drum or rotor assembly. Two opposed tapered roller bearings are installed in each hub (Fig. 1). A grease retainer is installed at the inner end of the hub to prevent lubricant from leaking. The entire assembly is retained on its spindle by the lock nut and/or adjusting nut and cotter pin.

FRONT WHEEL ASSEMBLY—FOUR-WHEEL DRIVE

The front axles used on 4-wheel drive models are described in Parts 15-30, 15-32 and 15-33 of this manual. The locking hub assemblies are described in Part 11-12.

REAR WHEEL ASSEMBLY

Information on rear wheels may be found in Group 11, Parts 11 and 14.

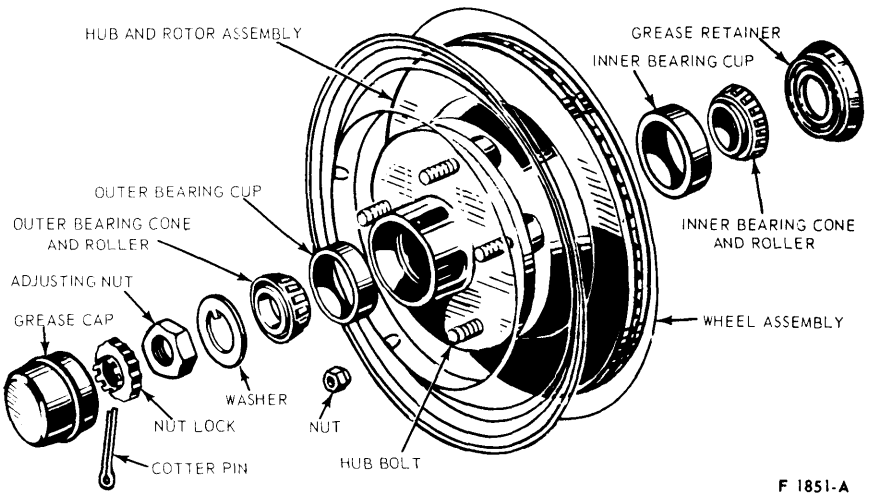

FIG. 1 Front Hub, Bearings and Grease Retainer—Disc Brakes—F100-F350, E100-E350

REMOVAL AND INSTALLATION

WHEEL REPLACEMENT

Light Vehicles

Removal

(if
sen
ud
d
tire clear the floor. When install

The hub cap should be positioned on the wheel over one of the retaining nubs and the two locating nubs. Be sure that the lip of the hub cap is firmly seated in the groove of the retaining nub, and then force the cap over the other retaining nub. **Any other procedure necessitates heavy pounding with possible damage to the hub cap.**

3. Remove the wheel stud nuts and the wheel and tire from the hub and drum assembly, or the hub and rotor assembly.

Installation

1. Clean all dirt from the hub and rotor assembly. The replacement wheel and tire must be clean.
2. Position the wheel and tire on the hub and rotor assembly, and install the

wheel stud nuts. Tighten the stud nuts enough to hold the wheel firmly in place. **Always tighten alternate nuts to draw the wheel evenly against the hub and drum (or hub and rotor).**

On dual wheels, except E-350 and F-350 be sure to back off the outer nut before tightening the inner nut. Then tighten the outer nut. E-350 and F-350 dual wheels have mounting bolt holes which are alternately flared inward and outward. These surfaces must be mated when the wheels are mounted. Fig. 2 illustrates the dual wheel radial alignment locating pin used on E-350 and F-350.

3. Lower the vehicle to the floor, and tighten the wheel stud nuts to the specified torque. **On a new vehicle, and each time a wheel and tire is installed, the wheel nuts should be tightened to specification and rechecked at 500 miles.**

Medium Vehicles

Removal

1. Loosen but do not remove the wheel stud nuts.
2. Raise the vehicle until the wheel and tire clear the floor.
3. Remove the wheel stud nuts and the wheel and tire from the hub and drum.

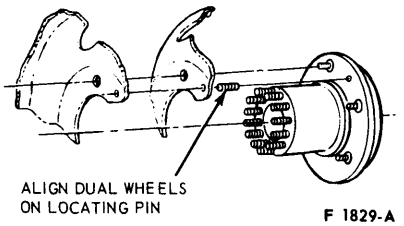

FIG. 2 Dual Wheel Radial Alignment to Hub (E-350, F-350)

Installation

1. Clean all dirt from the hub and drum. The replacement wheel and tire must be clean.
2. Position the wheel and tire on the hub and drum, and install the wheel stud nuts. Tighten the stud nuts enough to hold the wheel firmly in place. **Always tighten alternate nuts to draw the wheel evenly against the hub and drum.**

   On dual wheels, be sure to back off the outer nut before tightening the inner nut. Then tighten the outer nut.
3. Lower vehicle to the floor, and tighten the wheel stud nuts to the specifications. **On a new vehicle, and each time a wheel and tire is installed, the wheel nuts should be checked for tightness.**

TIRE REPLACEMENT PRECAUTIONS

The tire must be completely deflated before removal, and the bead must not be damaged by a tire iron.

After installation, a tube tire should be inflated to recommended pressure, deflated, and then inflated again to insure that the tube is not folded inside the tire. Be sure the tube flap is properly positioned before inflating the tire. **On F-100, -250, -350, Econoline, and Bronco series, it is important that each front and rear tire and wheel be balanced.**

When installing tires on F-100/350, and E-100/350 vehicles, thoroughly lubricate the tire beads. Inflate the tire until both bead seats against the rim of the wheel, then deflate to the specified "Tire Inflation Pressures" shown in the 1977 Truck Owners Manual for each vehicle series. To seat the tire beads, the initial inflation for passenger-type tires is 45 psi maximum; for truck-type tubeless tires, 60 psi maximum; for truck-type tube tires 80 psi maximum. Follow the instructions supplied with the Rotunda (35-002, 35-0010 or equivalent) tire changer. Refer to Part 11-01 for diagnosis and testing procedures, safety procedures and illustrations.

CF1804-E

Wheels and Tires — Two-Piece Rims

PART 11-03

APPLIES TO F-250, F-350 VEHICLES

DESCRIPTION

Two-piece rims are used on disc and cast wheels with tube-type tires only.

Refer to Part 11-01 for diagnosis and testing procedures, safety procedures and illustrations.

REMOVAL AND INSTALLATION

The tire must be completely deflated before removal, and the bead must not be damaged by a tire iron.

After installation, a tube tire should be inflated to recommended pressure, deflated, and then inflated again to insure that the tube is not folded inside the tire. Be sure the tube flap is properly positioned before inflating the tire.

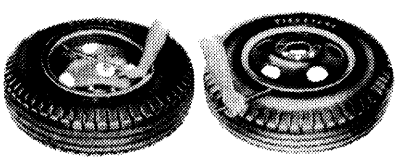
It is recommended that tire-changing equipment be used in changing all truck tires. See Safety Precautions in Part 11-01.

TIRE REMOVAL AND MOUNTING—TWO-PIECE RIM

Removing Tire from Wheel

If no tire-changing machine is available, remove tire as detailed in following Steps.

1. First, remove valve core and completely deflate the tire. Then, place the wheel (ring side up) on the floor. Insert the hook end of the rim tool between the ring flange and the tire and press downward on bead. Continuing around the ring, pry the tire off the tapered seat of the ring (Fig. 1).



F1460-B

FIG. 1 Removing Rim and Removing Tire—Two-Piece Rim

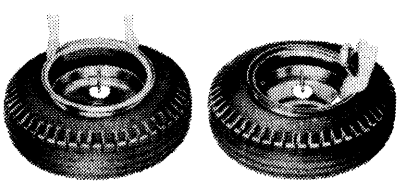
tool pry opposite portion of bead over edge of rim.

4. Stand assembly in vertical position. Lubricate second bead. At top of assembly insert straight end of tool between bead and back flange of rim at about a 45 degree angle. Turn tool so that it is perpendicular to rim. Pry second bead off.
5. Turn tire over. With rim tools, loosen bead on opposite bead seat. This can be further aided by using foot pressure.

   Make sure one portion of second bead is still in the rim well, then pry opposite portion of bead over edge of rim. This will free the tire from the rim.

Mounting Tire to Wheel

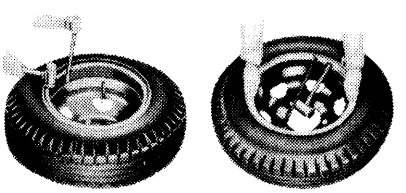
1. Place tire on rim so that valve is in line with rim slot and insert valve through the slot (Fig. 2). Force first bead down into well of rim just to side of valve. Mount first bead over rim lip with rim tool, progressing around the tire.



F1027-B

FIG. 2 Positioning and Starting Ring—Two-Piece Rim

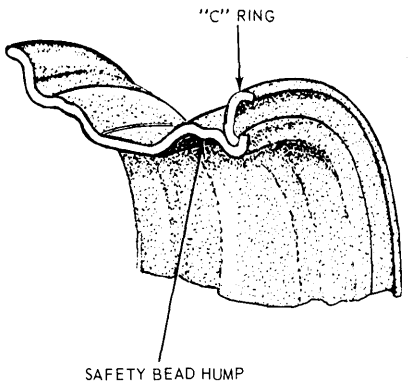
2. To apply second bead, start at point opposite valve and press tire bead over rim lip and into rim well (Fig. 3). Mount remainder of bead over rim lip by means of thin tire tool, being careful not to pinch tube. If necessary, insert second tire tool and lubricate last 6 inches of bead before completing mounting.



F1028-B

FIG. 3 Installing and Checking Ring—Two-Piece Rim

3. Place half of side ring under the rim lip with cutaway portions in position as shown. Insert thin end of rim tool or heavy screwdriver and pull ring



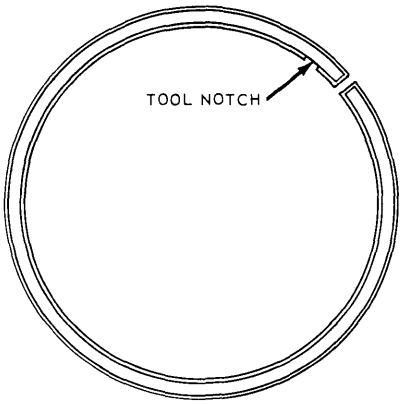


FIG. 4 Two-Piece Split Ring—Light Truck

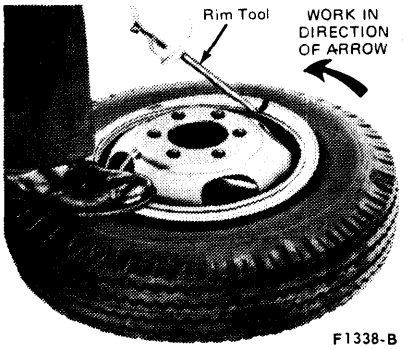

FIG. 6 Removing Split Ring

outward toward centered position. Strike with mallet to start ring over rim lip, then strike remaining portion to force it over rim lip.

TIRE REMOVAL AND MOUNTING—TWO-PIECE SEMI-DROP CENTER RIM—F250-F350

Recent developments make possible the removal and mounting of tires from this type of wheel-rim combination with mechanical tire-changing equipment. If available, follow instructions of equipment manufacturer. Otherwise, use the following instructions.

This two-piece wheel uses a split C-type ring, as shown in Fig. 4.

Removal of Side Ring from Rim with Tire

1. Deflate tire completely and place the wheel (ring side up) on the floor.
2. Break the tire bead free from the rim, being careful not to damage the bead (Fig. 5).
3. Insert the straight end of the rim tool into and under the notch in the ring (Fig. 6).
4. Force the tool downward to disengage the ring from the rim gutter. Work the tool around the rim, freeing the ring from the rim, and remove the ring.
5. Turn the wheel over and loosen the opposite tire bead from the rim by driving the hook end of the rim tool between the rim flange and the tire bead. Pry the tire bead away from the

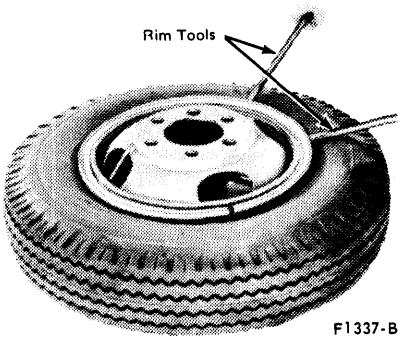

FIG. 5 Loosening Tire Bead

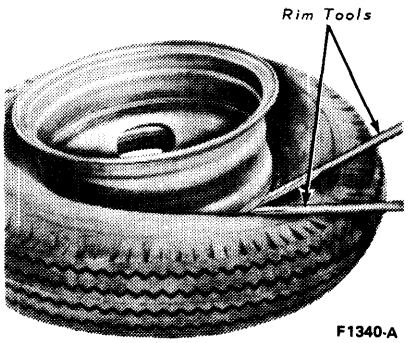

FIG. 7 Removing Tire From Rim

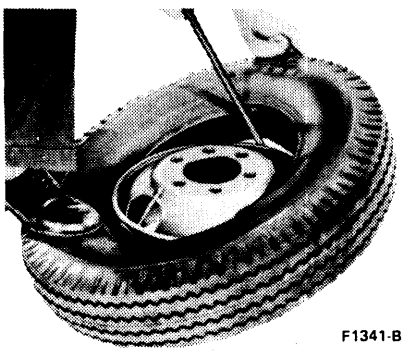

FIG. 8 Installing First Tire Bead on Wheel

Mounting Tire to Wheel

1. Position the tube in the tire and place the wheel (gutter side up) on the floor. Soap both beads of the tire and position the tire on the rim. It is important that the tire be soaped well as it must be forced over the safety bead hump and the rim edge (Fig. 8).
2. Position the ring with the notch about 3 inches from the valve stem.
3. Insert the rim tool under the ring at a position approximately 180 degrees from the notch and pry tire onto rim. Work the remaining section of rim over the gutter with a second tool.
4. Make certain that the ring is entirely seated in the gutter. If the ring is not seated correctly as described, it may be forced off violently, either during inflation or when the vehicle is operated.
5. After installation, inflate the tire and tube to 80 psi maximum to snap the tire beads over the bead hump and fully seat the tire against the rim and lock ring. Deflate the tire, then reinflate it to recommended pressure to insure that the tube is not folded inside the tire. Be sure the tube flap is properly positioned before inflating the tire. **Always use a cage or safety chain during initial inflation.**

Wheels and Tires — Three-Piece Rims

PART 11-04

APPLIES TO ALL 500-9000 SERIES VEHICLES

CF2463-A

DESCRIPTION

Three-piece rims are used on disc and cast wheels. Fig. 1 shows a dual wheel sectional view.

Demountable rims for cast-spoke wheels are secured by a ramp at the back edge of each spoke, together with a lug retained by a stud and nut at the edge of each spoke. Refer to Part 11-01 for diagnosis and testing procedures, safety procedures and illustrations.

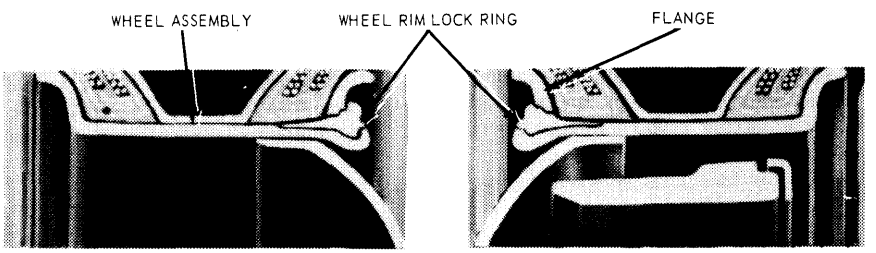

FIG. 1 Three-Piece Rim—Dual Wheel Sectional View

REMOVAL AND INSTALLATION

The tire must be completely deflated before removal, and the bead must not be damaged by a tire iron.

After installation, a tube tire should be inflated to recommended pressure, deflated, and then inflated again to insure that the tube is not folded inside the tire. Be sure the tube flap is properly positioned before inflating the tire.

TIRE REMOVAL AND MOUNTING—THREE-PIECE RIM

Tire mounting procedures are the same for disc wheels and for cast wheels equipped with the three-piece rims. However, cast wheels require special final centering and runout adjustment.

Removing Tire from Wheel

on tool and wn ol king

ring, and pry the locking ring out of the gutter (Fig. 2).

4. Lift out the locking ring, and remove the slide ring (Fig. 3).

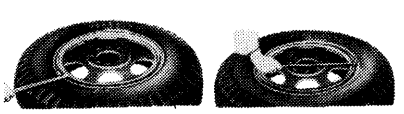

FIG. 2 Loosening Tire Bead and Locking Ring—Three-Ring Rim

FIG. 3 Removing Locking Ring and Positioning Locking Ring—Three-Piece Rim

5. Turn the wheel over and loosen the tire bead from the rim by driving the hooked end of the rim tool between the rim flange and the tire bead.
6. Pry the tire bead away from the taper all around the rim until tire is free and remove the tire.

Mounting Tire to Wheel

1. Position the wheel (gutter side up) on the floor. Soap both beads of the tire and position the tire on the rim.
2. Position the solid side ring on the tire and insert the tapered toe of the split locking ring between the rim and the side ring (Fig. 3).
3. Using a soft hammer, drive the locking ring into place (Fig. 4). Start at one end of the split ring and progressively drive the ring into the gutter until the entire ring is seated (Fig. 4).

The ring must be entirely seated around the entire circumference of the rim. The split ends must be engaged in the gutter, or the ring will be forced off

violently during inflation or when vehicle is driven. When inflating the tire do not stand in front of the ring. See Safety Precautions in Part 11-01.

TIRE REMOVAL AND MOUNTING—CAST WHEELS

Removal

1. To remove the rim and tire from a cast wheel, apply the parking brake, and block at least one wheel. Raise the vehicle and remove the rim clamps.
2. With dual rear wheels, lift off the outer rim and tire, remove the spacer rim, and the inside rim and tire assembly.

Installation

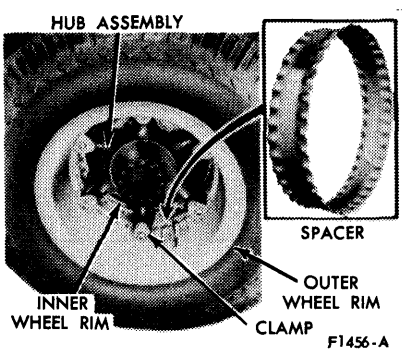
1. To install the tire and rim on a dual wheel, place the inner tire and wheel on the wheel hub. The rim must ride high enough up on the tapered retainer flange of the inner section of the wheel to prevent the assembly from sliding down on the tapered surface.
2. Position the spacer between the inner and outer rim.
3. Place the outer rim and tire assembly on the wheel, and install the clamps (Fig. 5).

F1463-A

FIG. 4 Starting Locking Ring and Locking Ring Installed—Three-Piece Rim

4. Tighten the top clamp until the spacer pushes the inner rim onto the tapered surface of the wheel inner section.
5. Tighten the bottom clamp to help center the rim on the wheel.
6. Tighten the remaining clamps alternately and evenly, and tighten all wheel nuts to specification.

NOTE: The recommended procedure for tightening five spoke cast wheels is by "triangulation" as shown in Fig. 6. Turn nut number 1 until snug, then rotate the wheel and rim assembly until nut number 3 is at the top position. Turn the nut until snug. Rotate the wheel and rim assembly until nut number 4 is at the top postion and turn the nut until snug. Since the entire weight of the wheel and rim assembly is on the top spoke position, this procedure allows equal application of force against three points of the rim for proper alignment. Repeat the triangle procedure, tightening each nut to the recommended specifications. Tighten the remaining nuts (2 and 5) to specifications.



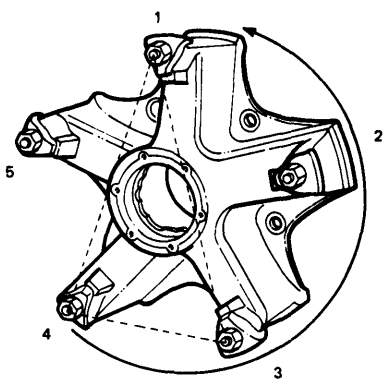
F1456-A

FIG. 5 Three-Piece Rim Installed on Cast Wheel

See the manufacturers recommendations for tightening procedures for six spoke wheels and three spoke single or double clamp wheels.

After 50-100 miles of operation, the nuts should again be tightened to specifications and thereafter periodically inspected and tightened.

Lateral or side runout should not exceed 1/8-inch for the front rims and 1/4-inch for the dual rear rims. **Lateral or side runout must be checked at the outer bead surface of the wheel.**



F2462-A

FIG. 6 Five Spoke Cast Wheel Nut Tightening Procedure

Wheels, Hubs and Bearings — Front (Except Front Drive)

PART 11-10

APPLIES TO ALL MODELS

DESCRIPTION

FRONT WHEEL ASSEMBLY

Each front wheel and tire assembly is bolted to its respective front hub and brake drum or rotor assembly. Two opposed tapered roller bearings are installed in each hub, Figs. 1 and 2. A grease retainer is installed at the inner end of the hub to prevent lubricant from leaking into the drum or onto the rotor. The entire assembly is retained to its spindle by the lock nut and/or adjusting nut and cotter pin, or an adjusting nut and lock nut combination.

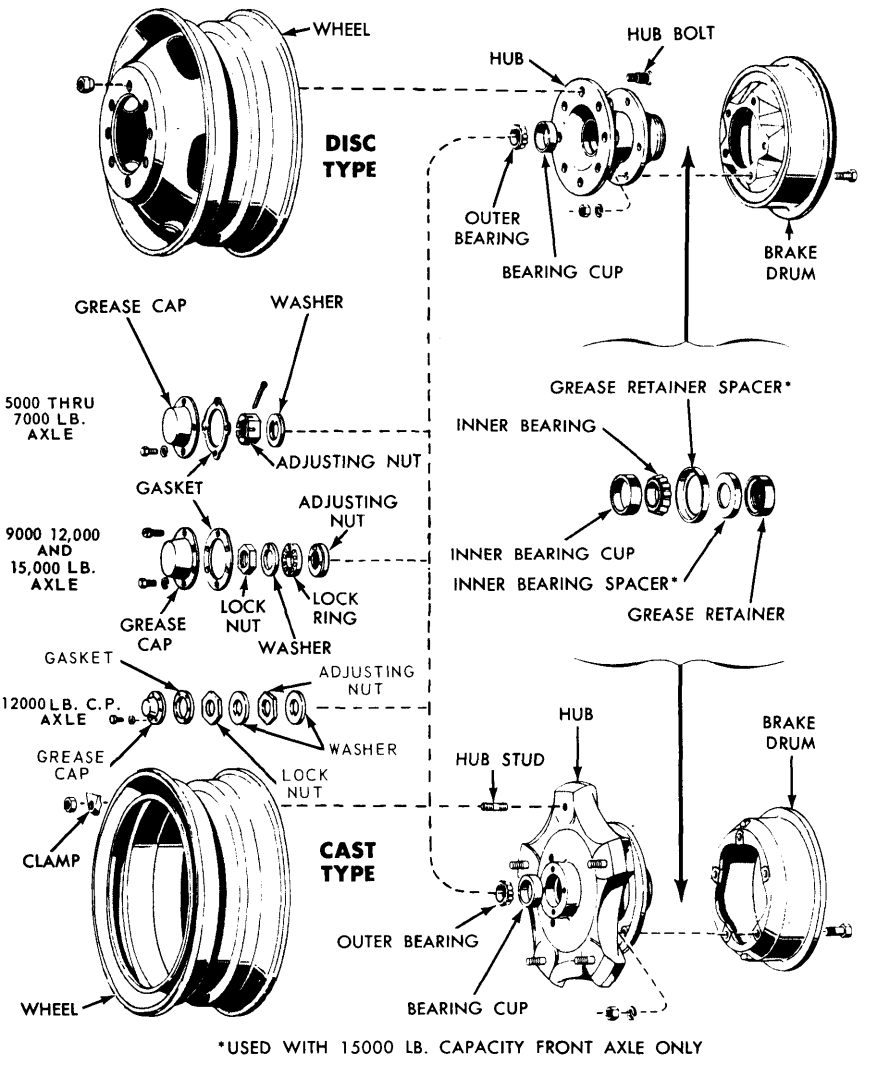


FIG. 1 Typical Front Hubs and Bearings

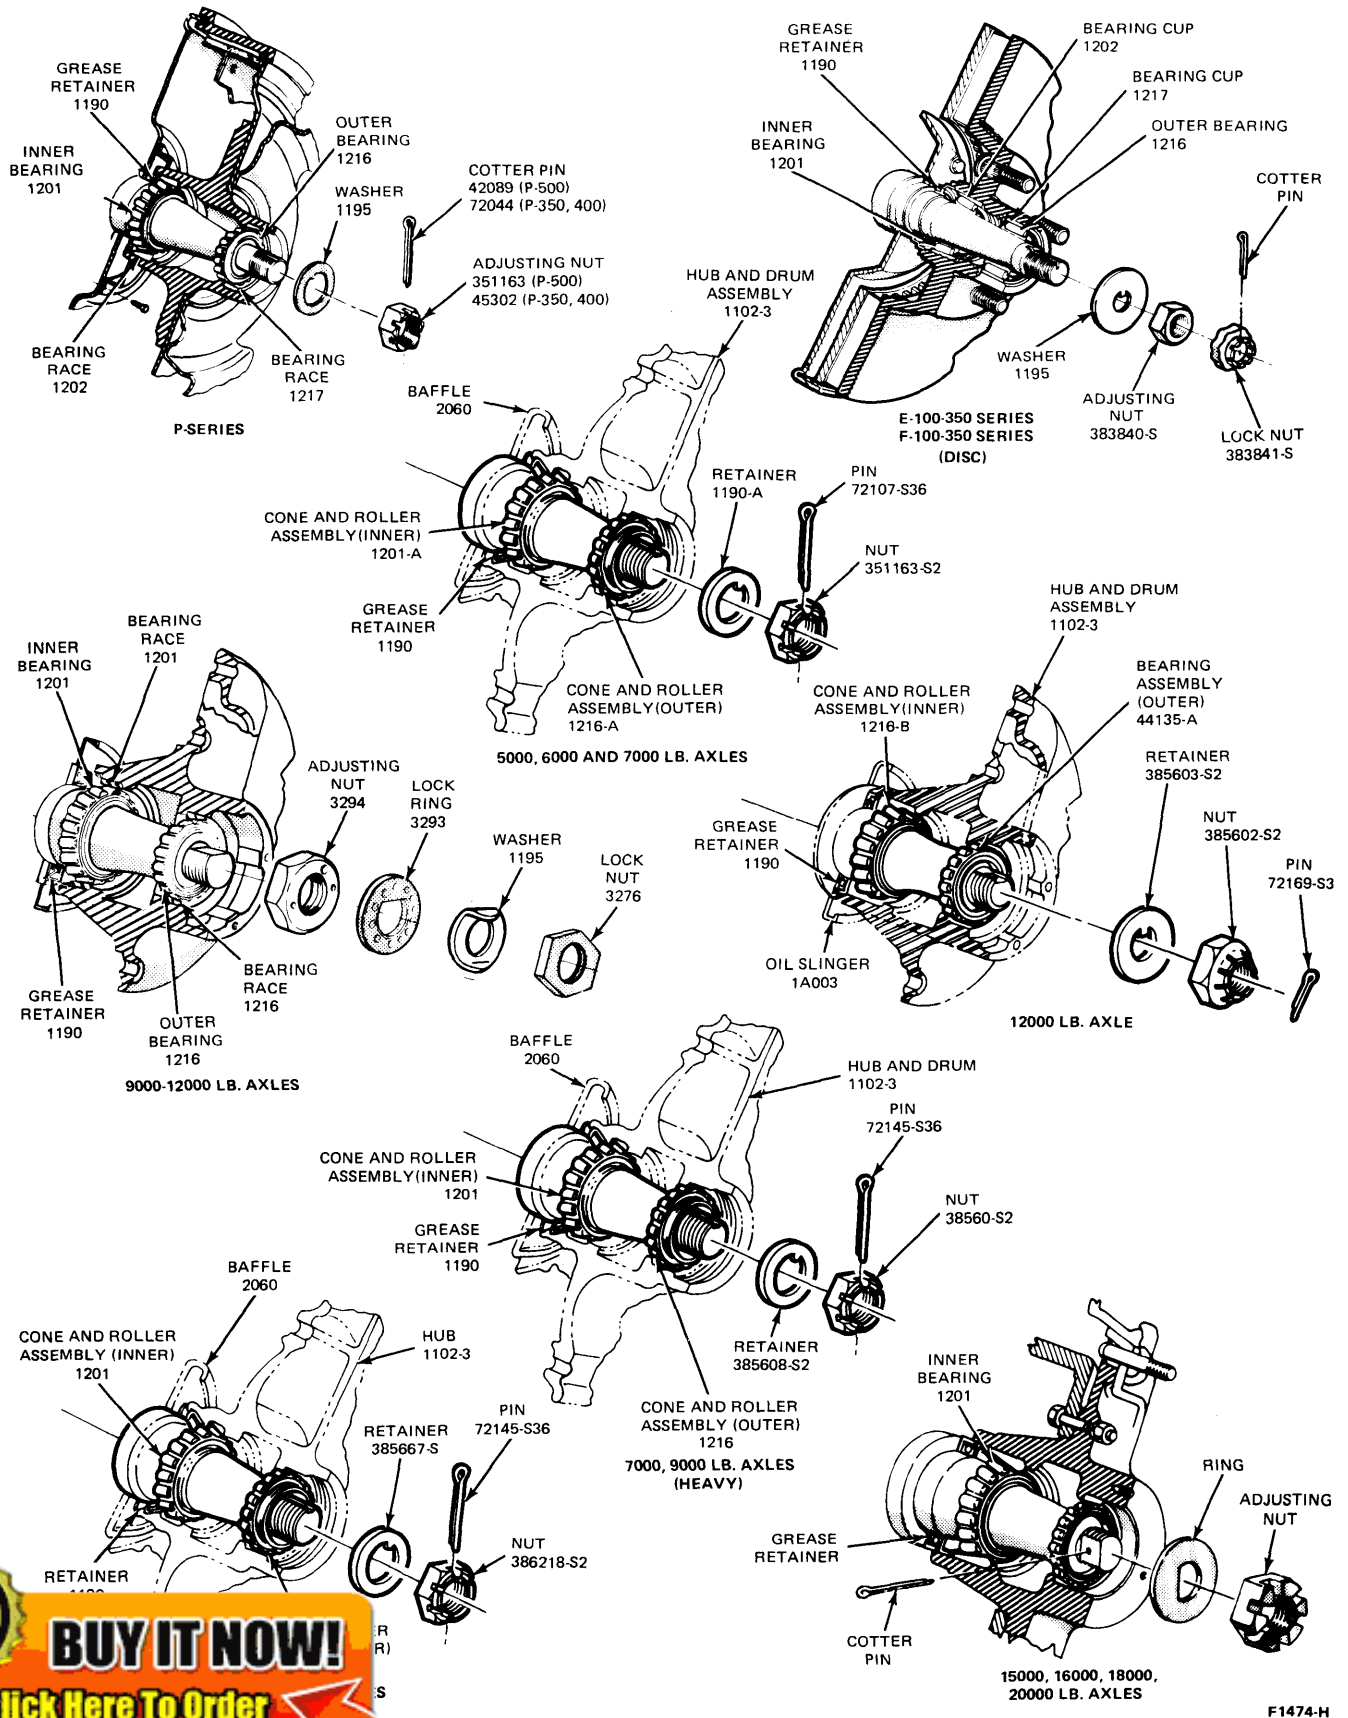


ease Retainers

ADJUSTMENTS

FRONT WHEEL BEARING ADJUSTMENT

To check the wheel bearing adjustment, raise the front of the vehicle. Then, grasp the tire at the sides, and alternately push inward and pull outward on the tire. If any looseness is felt, adjust the front wheel bearings.

F100-F350 (4x2) AND E100-E350

1. Remove the hub cap or wheel cover, wheel and tire assembly, disc brake caliper and pads, (refer to Part 12-24), dustcap, retainer and cotter pin.
2. Tighten wheel retention nut to 22-25 ft-lbs while rotating the disc brake rotor in the opposite direction.
3. Back off the wheel retention nut 1/4 turn and install retainer and cotter pin without additional movement of wheel nut.
4. Re-install dustcap, caliper, pads and wheel and tire assembly.

P-500

1. Remove hub cap, if so equipped, and remove grease cap from hub.
2. Remove any excess grease from the end of the spindle and remove the adjusting nut cotter pin.
3. While rotating the wheel, tighten the adjusting nut, (see Fig. 2), to 40-50 ft-lb to seat the bearings.
4. If necessary, back off the adjusting nut to the next slot so nut aligns with the cotter pin hole. Then, back off the adjusting nut two slots and install the cotter pin.
5. Check the front wheel rotation. If the wheel rotates freely with no noticeable end play, install the grease cap. If the wheel is still loose, or if it rotates roughly or noisily, the bearing cones, rollers and cups are dirty or worn and should be cleaned or replaced.
6. Install the hub cap, if so equipped.

ALL MEDIUM, HEAVY AND EXTRA-HEAVY TRUCKS

Single Nut with Cotter Pin (5000-7000 Pound Front Axles)

1. While rotating the wheel, torque the adjusting nut, 70 to 100 ft-lb, to seat the bearings.
2. Back off the adjusting nut 180 degrees
3. Install the gasket and grease cap and adjust the brakes. **The final adjustment must not result in a preloaded bearing.**

Double Nut with Lock Ring (15000-Pound Front Axle)

1. While rotating the wheel in both directions, torque the adjusting nut, 100 to 125 ft-lb to seat the bearings.
2. Back off the adjusting nut one complete turn, Fig. 2.
3. Again, rotate the wheel in both directions, and re-torque the adjusting nut, 40 to 55 ft-lb.
4. Back off the adjusting nut to obtain an initial .004 to .010-inch end play between the wheel hub and spindle.
5. Install the lock ring. Make sure that adjacent nut dowel is inserted into a lock ring hole.
6. Install the washer with the dimple indexed in one of the holes in the lock ring.
7. Install lock nut and tighten, 100 to 125 ft-lb.
8. Re-check the end play. (Final bearing adjustment must allow .001 to .010 end play.) Re-adjust if necessary.
9. Bend the washer outward in two places, on opposite sides of lock nut, to lock the nut in position.
10. Install the gasket and grease cap and adjust the brakes. **The final adjustment must not result in a preloaded bearing.**

Double Nut with Double Washer (12000-Pound Center Point Axle)

1. While rotating the wheel in both directions, tighten the adjusting nut, 100 to 125 ft-lb to seat the bearings.
2. Back off the adjusting nut one complete turn, Fig. 2.
3. Again, while rotating the wheel in both directions, re-tighten the adjusting nut, 40 to 55 ft-lb.
4. Back off the adjusting nut to obtain an initial .004 to .010-inch end play between the hub and spindle.
5. Install the outer washer and lock nut and tighten, 100 to 125 ft-lb.
6. Re-check the end play (final limit .001 to .010 inch). Re-adjust if necessary.
7. Bend the washer outward in two places, on opposite sides of lock nut, to lock the outer nut in position.
8. Install the gasket and grease cap and adjust the brakes. **The final adjustment must not result in a preloaded bearing.**

Single Nut with Cotter Pin (16000-, 18000-and 20000-Pound Front Axle)

1. While rotating the wheel in both directions, tighten the adjusting nut, 100 to 125 ft-lb to seat the bearings.
2. Back off the adjusting nut one complete turn, Fig. 4.
3. Again rotate the wheel in both directions, and re-torque the adjusting nut, 50 to 70 ft-lb.
4. If necessary, back off the adjusting nut to align a slot with the next cotter pin hole.
5. Using the same cotter pin hole as a reference point, back off the adjusting nut to the next slot to allow the wheel to rotate freely within the limits of .001 to .010-inch end play.
6. Insert and secure the cotter pin.
7. Install the gasket and grease cap and adjust the brakes. **The final adjustment must not result in a preloaded bearing.**

Double Nut with Lock Ring (9000-and 12000-Pound Front Axle)

1. While rotating the wheel in both directions, tighten the adjusting nut, 100 to 125 ft-lb to seat the bearing.
2. Back off the adjusting nut one complete turn.
3. Then, again rotate the wheel in both directions, and re-torque the adjusting nut, 50 to 70 ft-lb.
4. Back off the adjusting nut to obtain an initial .004 to .010-inch end play between the hub and spindle.
5. Install the lock ring making sure the adjusting nut dowel is inserted into the lock ring.
6. Install the outer washer, locating dimple in washer in one of the lock ring holes, and install the lock nut. Tighten, 100 to 150 ft-lb.
7. Re-check to make sure the final bearing adjustment allows .001 to .010-inch end play. Re-adjust if necessary.
8. Bend the washer outward in two places, on opposite sides of the lock nut, to lock the outer nut in position.
9. Install the gasket and grease cap and adjust the brakes. **The final adjustment must not result in a preloaded bearing.**

REMOVAL AND INSTALLATION

FRONT WHEEL GREASE SEAL AND BEARING REPLACEMENT AND REPACKING

Wheel bearing lubricant is a lithium-base grease, Ford specification ESA-M1C75-B or equivalent.

Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front and/or rear wheel bearings without first ascertaining the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants could result in premature lubricant breakdown.

If bearing adjustment will not eliminate looseness or rough and noisy operation, the hub and bearings should be cleaned, inspected, and repacked with specified wheel grease. If the bearing cups or the cone and roller assemblies are worn or damaged, they should be replaced.

DRUM BRAKES

P-500

1. Raise the vehicle until the wheel and tire clear the floor. Remove wheel and tire from hub. If drums will not remove easily, back off the brake shoe adjusting screw so that the shoes do not contact the brake drum. Remove grease cap from the hub.
2. Remove the cotter pin, nut lock, adjusting nut and washer from the spindle, Fig. 2.
3. Remove the outer bearing cone and roller. Pull the hub and drum assembly off the wheel spindle. Then, remove and discard the grease retainer. Remove the inner bearing cone and roller from the hub. **Remove all traces of old lubricant from bearings, hubs, and axle spindle.**
4. Inspect the cups for scratches, pits or cracks. If the cups are worn or damaged, remove them with a drift.
5. Clean the inner and outer bearing cones and rollers with solvent and dry thoroughly. **Do not spin the bearings dry with compressed air.**
6. Inspect the cones and rollers for cracks, nicks, brinelling, or seized rollers. Inspect the grease retainer and replace it if it is cracked, nicked, or dented.
7. Cover the spindle with a clean cloth and brush all loose dust and dirt from

they are fully bottomed.
9. Pack the inside of the hub with Multi-Purpose Lubricant Ford specification ESA-M1C75-B or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.
10. Place the inner bearing cone and roller in the inner cup and install the grease retainer (Fig. 4) with the appropriate driving tool. Be sure that the retainer is fully bottomed.
11. Install the hub and drum on the wheel spindle. **Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads.**
12. Install the outer bearing cone and roller and the flat washer on the spindle, then install the adjusting nut, and adjust the wheel bearing as outlined under Adjustments. Install the adjusting nut lock, cotter pin and grease cap.

DISC BRAKES

F-100—F-350, E-100—E-350

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly from the hub and rotor.
2. Remove the brake caliper, (refer to Part 12-24), and wire it to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.
3. Remove the grease cap, cotter pin, retainer, nut and washer.
4. Remove the outer bearing cone and roller.
5. Pull the hub and rotor off the spindle and remove and discard the grease retainer.
6. Remove the inner bearing cone and roller from the hub. Remove all traces of old lubricant from bearings, hub and axle spindle.
7. Inspect the cups for scratches, pits or cracks. If the cups are worn or damaged, remove them with a drift. Clean the inner and outer bearing cones and rollers with solvent and dry thoroughly. **Do not spin the bearings dry with compressed air.**
8. Inspect the cones and rollers for cracks, nicks, brinelling, or seized rollers. Inspect the grease retainer and replace it if it is cracked, nicked, or dented.
9. Cover the spindle with a clean cloth and brush all loose dust and dirt from the brake assembly. **Remove the cloth from the spindle carefully to prevent dirt from falling on the spindle.**
10. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with tool T56P-1217-A, (Fig. 3). Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed.
11. Pack the inside of the hub with C1AZ-19590-B Multi-Purpose Lubricant or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.
12. Place the inner bearing cone and roller in the inner cup and install the new grease retainer with driving tool T37T-1190-B, (Fig. 4). Be sure that the retainer is fully bottomed.
13. Install the hub and rotor on the wheel spindle. **Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads.**
14. Install the outer bearing cone and roller and the flat washer on the spindle, then install the adjusting nut, and adjust the wheel bearing as outlined under Adjustments. Install the grease cap.
15. Install the caliper, (refer to part 12-24).
16. Install the wheel and tire assembly on the hub.
17. Lower the vehicle and tighten the lug nuts to specification. Re-install the wheel cover or hub cap.

MEDIUM, HEAVY AND EXTRA-HEAVY VEHICLES

There are two basic types of hubs, disc and cast, shown in Fig. 1. The basic design of the hub bearings is the same in all hubs, but minor differences in size exist between the various models. The outer bearing attaching parts differ according to front axle weight capacity as indicated in Fig. 1. For further detailed views of hubs, bearings, and grease retainers, see Fig. 2.

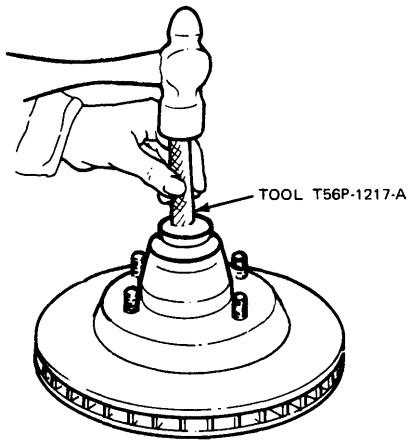
1. Raise the vehicle until the tires clear the floor and install safety stands to support the front axle. Remove the grease cap and gasket from the hub.
2. To check the wheel bearing adjustment, alternately push inward and outward on the tire. If there is

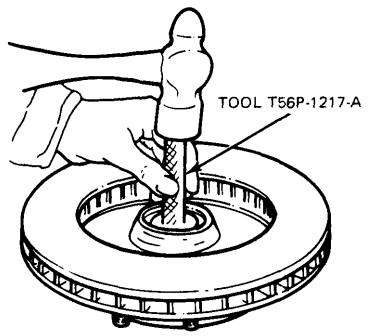
any excessive looseness, or if there is no end play, adjust the front wheel bearing.

3. With 5000, 5500, 6000, 7000, 16000, 18000 or 20000-pound capacity front axles, remove the cotter pin, adjusting nut and flat washer from the spindle. Proceed to Step 4.

   With 9000, 12000 or 15000-pound capacity front axles, remove the lock nut, washer, locking ring and the adjusting nut and pin. Proceed to Step 4.

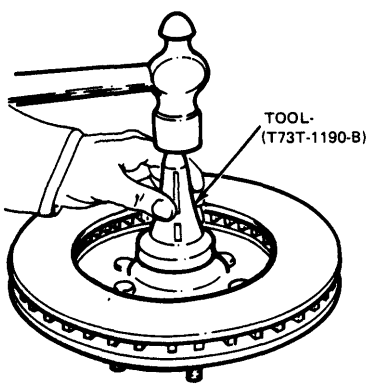
   With a 12000-pound capacity center point front axle, remove the lock nut, inner washer, adjusting nut and outer washer.
4. Inspect the condition of the spindle and nut threads to insure a free running nut when reassembling.
5. Remove the outer bearing cone and roller. Pull the hub and drum assembly off the spindle.
6. Remove the inner bearing and seal using a brass drift. **Be careful not to damage the bearing cage.**
7. Remove all traces of old lubricant from the bearings, hubs and axle spindle. Inspect the cups for pitting, galling or unusual wear. If either cup is worn or damaged, remove it with a brass drift.
8. Clean the inner and outer bearing cones and rollers with solvent and dry them thoroughly. **Do not spin the bearings dry with compressed air.**
9. Inspect the cones and rollers for pitting, galling or unusual wear. Closely inspect the rollers for end wear and flat or rough spots. Replace all worn or damaged assemblies. It is recommended that the cone and roller assemblies and cups be replaced in sets.
10. Replace the grease retainer.
11. Cover the spindle with a clean cloth and brush all loose dust and dirt from the brake assembly. Remove the cloth from the spindle carefully to prevent dirt falling on the spindle.
12. Install the inner and outer bearing cups in the hub with tool T56P-1217-A, (Fig. 5). Check for proper seating of the new bearing cups by trying to insert a 0.0015-inch feeler gauge between the cup and wheel hub, the feeler gauge should not enter.
13. Pack the inside of the hub with lithium-base wheel bearing grease Multi-pose lubricant Ford specification





F2474-A

FIG. 3 Installing Bearing Cups



F1465-B

FIG. 4 Installing Grease Retainer

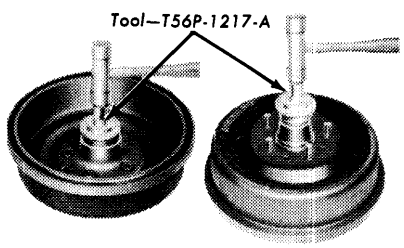
the rollers and cages. Lubricate the cone surfaces with grease.

14. Place the inner bearing cone and roller in the inner cup and install the grease retainer with the appropriate tool. Be sure the retainer is fully bottomed.

    On all synthetic-type seals, coat the seal lips with wheel bearing grease such as Multi-Purpose lubricant Ford specification ESA-M1C75-B or equivalent, before installing the hub and drum. On seals not coated on the OD with sealer by the supplier, coat the grease seal bore in the hub with a thin coat of non-hardening sealer prior to installing the grease seal.
15. Install the hub and drum on the wheel spindle. **Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads.**
16. With 5000, 5500, 6000, 7000, 16000, 18000 or 20000-pound capacity front axles, install the outer bearing cone and roller and the flat washer on the spindle. Then, install the adjusting nut.

    With 9000, 12000 and 15000-pound capacity front axles, install the outer bearing cone and roller and the bearing adjusting nut.

    With a 12000-pound capacity center point front axle, install the washer and adjusting nut. Make the final bearing adjustment. See Adjustments, this Part.



F1464-A

FIG. 5 Installing Bearing Cups

MEDIUM, HEAVY AND EXTRA HEAVY VEHICLES (OIL LUBRICATION)

Stemco Seals and National Seals, available as regular production options, provide sealing where oil is used for bearing lubrication. The tools required for Stemco Seal Installation are only available from the Stemco warehouse. Refer to Specifications for the tooling required. Fig. 6 illustrates a front wheel Stemco Seal Installation.

FRONT HUB SEAL INSTALLATION

Stemco Seals

Clean all parts thoroughly before starting the installation.

1. Oil the spindle and push the axle ring flush against the axle face where applicable.
2. Remove all burrs from the wheel hub bore seal area, and clean again.
3. Pack grease between the spring and the seal lip. This will prevent the spring from dislocating when the seal is installed.
4. Position the seal in the hub bore (Part Number Up). Drive the seal into position using the correct tool. It must be perfectly square with the bore, and bottom evenly.
5. Install the wheel and adjust the bearings. Install the Stemco hub cap.
6. Remove the filler plug and add premium oil Ford specification ESW-M2C105-BSAE 90 or equivalent. Double check the oil level before releasing the vehicle for service. Oil level must be between the oil level line on the hub cap to 1/4-inch above the line.

NATIONAL SEALS

Install (Fig. 7) as follows:

1. Clean all parts, remove rough spots and install axle ring flush against face where applicable.
2. Position the seal into the hub (notice oil side marking) with drive tool and lightly hammer into a press fit.
3. Install the wheel and adjust the bearings the same as for any seal installation. Install the see-through hubcap and the retaining screws.
4. Remove the filler plug and add oil to level on see-through hubcap.
